Spasmofilni neuropathie (spasmofilni neuropathicky teren) a spasmofilni neurosa u dospelych a u deti. (Spasmophilic neuropathy (Spasmophilic Neuropathic Terrain) and Spasmophilic Neurosis in Adults and Children. 1st ed. illus., bibl, English and Russian summaries.) Prague, SZdN, 1957. 110 p. No. 366 of the series Thomayerova sbirka prednasek and rozprav z oboru lekarskeho (Thomayer's Collection of Lectures and Discussions on Medicine)

The study is drawing attention to the relatively frequent, although hidden and, in a way, different, neuropathic terrain of the so-called spasmophilic neuropathy, determination of which is important for the prevention, diagnosis, inspection, and therapy in various branches of medicine. It is determined by certain tests, i.e. by the phenomena of the mechanical idioneural excitability positively demareated in certain peripheral nerves. The book is intended for physicians in all medical fields.

"Clinical and Experimental Study of Central Effects of Adrenochrome."  
Prague, Ceskoslovenska Psychiatrie, Vol 58, No 6, 1962; pp 383-393.

Abstract [English summary modified]: Synthetic adrenochrome, from one home-made and one imported batch, administered sublingually 15 or 30 mg. to 15 volunteers including 5 psychiatric patients. Psychotic reactions were nearly universal, resembling LSD and psilocybin effects in some of the patients. Comprehensive data from this study tend to confirm hypotheses of Saskatchewan group that schizophrenia is somehow related to metabolic deficiencies of epinephrine breakdown. Table, 2 graphs; 3 Czech, 1 Soviet, 13 Western references.

"Biochemical Properties of Propazepine."

Prague, Activitas Nervosa Superior, Vol 5, No 2, May 63; pp 176-180.

Abstract: Imipramine and propazepine were found not to affect MAO in vivo in rat liver and brain, but repeated daily doses over 4 days apparently actually increased MAO activity in the liver. Both drugs decreased serotonin adsorption by platelets in vitro, and neither affected enzymatic oxidation of epinephrine. Graph; 5 Western and 1 Czech reference.

Prague, Casopis Lekarů Ceských, Vol CII, no 40, 4 October 63, pp 1099-1102.

Abstract [Authors' English summary, modified]: A comparison of the concentration of electrophoretically divided lipoproteins in guinea pigs saturated with vitamin C and suffering from avitaminosis showed that early stages of the C avitaminosis increased significantly the level of  $\alpha_1$  and decreased the level of  $\alpha_2$  lipoproteins. A liver damage caused by administering carbontetrachloride had a considerable effect on the serum level of the lipoprotein fractions. In the first two days of intoxication both the saturated and avitaminous guinea pigs showed an increase of the

"Comparison of the Effects of Iproniazid, Methylene Blue and Ben-  
actyzine on Angina Pectoris."

Prague, Casopis Lekaru Ceskych, Vol 105, No 22, 3 Jun 66, pp  
591 - 597

Abstract [Authors' English summary modified]: Methylene blue was  
much less effective than iproniazid; although there was a favorable  
effect on heart angina, it was positive only in 24% of the cases in-  
vestigated. The decreased blood pressure and pulse rate are probably  
the reason for the favorable effect of both drugs. Benactyzine was  
found to be ineffective, and in 2 patients even increased the pain.

TITLE: Dissociation of dislocations on {110} planes in anisotropic bcc metals

SOURCE: Physica status solidi, v. 15, no. 2, 1966, 557-566.

TOPIC TAGS: anisotropic metal, ~~dislocation dissociation~~, elasticity theory, ~~body centered cubic metal~~, ~~Burgers vector~~ *medium, cubic crystal, crystal dislocation, metal*

ABSTRACT: The dissociation of dislocations with Burgers vector  $1/2 \langle 111 \rangle$  and  $\langle 100 \rangle$  on {110} planes body centered cubic metals is studied. An analysis of the possible dissociations is carried out for eleven bcc metals, using the anisotropic elasticity theory. For those dissociations which are found to be energetically favorable, the widths of the extended dislocations are computed as functions of the stacking fault energy. "The Excretion of 6-Hydroxylated Metabolites of Indoleacetic Acid Following Peroral Loading with Indoleacetic Acid."

Prague, Activitas Nervosa Superior, Vol 8, No 4, Nov 66, pp 378 - 380

Abstract: Hydroxylation of IAA in the 6th position is discussed; its physiological meaning is unknown, but it is probably one of the detoxication reactions. The 6-hydroxylated compounds of indole affect the CNS more than the original compounds. Excretion of 6-HIAA after a peroral load of 3g of IAA was studied in 6 healthy subjects. The excretion of 6-HIAA increased to 26 mg / day from an original 8.2 mg as a result of the loading. 1 Figure, 8 Western, 2 Czech references. Submitted at the 8th Annual Psychopharmacological Meeting at Jesenik, 18 - 22 Jan 66. Article is in English.

"Hydroxylation of Indoleacetic Acid and of Tryptamine in Vitro; the Action of Monoaminoxidase Inhibitors."

Prague, Activitas Nervosa Superior, Vol 8, No 4, Nov 66, pp 373-375

Abstract: The influence of iproniazid and tranylecypromine on hydroxylation of 6-hydroindoleacetic acid in vitro was investigated. Liver tissue had 10 times as high a hydroxylating activity for tryptamine as indoleacetic acid (IAA). Small intestine mucosa can hydroxylate tryptamine to 6-hydroxytryptamine, but its 6-hydroxylating potency is only 1/10 that of the liver. Iproniazid inhibited conversion of 6-HT by 16%; tranylecypromine showed no inhibitory action. 1 Figure, 1 Table, 3 Western, 1 Czech, 2 Japanese references. SOURCE: Activitas nervosa superior, v. 7, no. 3, 1965, 261-262

TOPIC TAGS: serotonin, pharmacology, rabbit, man

ABSTRACT: Imipramine reduces the reabsorption of biogenic amines released by nervous impulses. Thereby the level of adronaline and serotonin in the tissues is reduced. Thrombocytes bind serotonin very fast, and therefore are suitable for the investigation of the effect of imipramine. The authors used rabbit thrombocytes for experiments in vitro; they found that the efficacy of propazepine was only  $\frac{1}{3}$  that of imipramine. Human thrombocytes in vivo indicated that propazepine had an effect one-third smaller than imipramine. [Orig. art. in Eng.] [JPRS]

ABSTRACT: The test is a valuable indicator of the monoamine oxidase inhibition in man if the investigated subjects have a minimum basic conversion of 50%, and if the variability of the conversion was examined before the test. The excretion of 5-hydroxyindoleacetic acid must be checked after more than 8 hours after test. An inhibition of conversion larger than 50% may be taken as a clear proof of monoamine oxidase inhibition. [Orig. art. in Eng.] [JPRS]

TOPIC TAGS: amino acid, experiment animal, pharmacology, nervous system drug

ABSTRACT: In experiments on monkeys, the authors found that the effect of l-cycloserine (CS) is antagonized by administration of sodium glutamate. Experiments on patients showed that of the drugs, psilocybin and iproniazide potentiate the effect of CS while amphetamine has no effect on the CS action. The effect of CS was also antagonized by alpha-ketoglutaric acid, pyridoxine methionine and succinic acid. The neurotoxic effect was also potentiated by dl-DOPA, l-leucine, and l-serine. /Orig.

Z/0055/64/014/005/0337/0346

AUTHOR: Kroupa, F.; Vitek, V.

TITLE: Splitting of dislocations in b.c.c. metals on  $\{110\}$  planes

SOURCE: Chekhoslovatskiy fizicheskiy zhurnal, v. 14, no. 5, 1964, 337-346

TOPIC TAGS: elastic energy, good material, bad material, stored energy, screw dislocation, crystallography, stacking fault, solid state physics, metal crystal, metal crystal distortion, crystal dislocation

ABSTRACT: This article examines three possible splittings of a screw dislocation on  $\{110\}$  planes of a metal with a b.c.c. lattice. Their total elastic energy is calculated and the dependence of the splitting width on the stacking fault energy is studied. The three possible screw dislocation splittings are shown in Figure 2 of the enclosure. In case (a), the splitting occurs on a single  $\{110\}$  type plane. In case (b), the screw dislocation with  $b = \frac{1}{2} [111]$  splits on three  $\{110\}$  type planes into four dislocations according to the reaction

$$\frac{1}{2} [111] = \frac{1}{8} [110] + \frac{1}{8} [101] + \frac{1}{8} [011] + \frac{1}{8} [111].$$

Card 1/4

ACCESSION NR: AP4038557

In case (o), the screw dislocation with Burgers vector  $b = \frac{1}{2} [111]$  again splits into six partials according to the reaction

$$\frac{1}{2} [111] = \frac{1}{8} [110] / \frac{1}{8} [110] / \frac{1}{8} [101] / \frac{1}{8} [101] / \frac{1}{8} [011] / \frac{1}{8} [011].$$

The total elastic energy per unit length of the extended dislocation is equal to

$$E = E_0 / E_{INT}^S / E_{INT}^E$$

where  $E_{INT}^S$  is the interaction energy of the partials and  $E_{INT}^E$  is the interaction energy of the edge parts. Author shows that the total stacking fault energy is one or two orders lower than the elastic energy  $E$  for the equilibrium width of the extended dislocation. Alpha type splitting can occur during plastic working with a general dislocation loop in the  $\{110\}$  slip plane. The Burgers vector will also lie in the same plane. The only possible configuration here is the a type, for which the dislocation moves in  $\{110\}$  planes. The b and c configurations of Figure 1 are possible only with immobile pure screw dislocations. Before putting the screw dislocation with b or c configuration into motion, it must first be transformed into an a configuration. Splitting of the b or c type can also be responsible for the fact that the immobile screw parts of the dislocation are straight. With further

Card 2/4

ACCESSION NR: AP4038557

slip, movement takes place on that plane of {110} type planes on which the repeated a type splitting is energetically most favorable. "We wish to express our thanks to B. Sestak, CSC, and S. Libovicky for valuable comments and M. Jirincova for her help in carrying out the numerical calculations." Orig. art. has: 5 figures and 16 equations.
